

We receive a lot of questions on what is the best type of faucet to purchase. For a standard faucet most would agree this is a forward seal faucet, (vs the older rear seal design) in 304 stainless steel. This leads to the next question. What is the best forward seal faucet? Here is a comparison between the CMBecker V3S, V2G and the Perlick 630SS.

Features:	CMB V3S	CMB V2G	Perlick 630
304 Stainless Steel Construction	Yes	Yes	Yes
Forward Seal (and method)	Yes, Piston Chamber	Yes, Piston Chamber	Yes, Ball on lever
Creamer Action, (for fine foam adjustment)	Yes	Yes	No
Safe for Beer, Wine and a variety of other liquids	Yes	Yes	Yes
“Stick Resistant” between cleanings	Yes	Yes	Yes
Leaking or “Dripping issues”	No	No	Maybe, but improved *
Warranty, USA	2 Year	2 Year	30 Days
Interchangeable Spouts, Long and Short versions available for wine, beer and other.	Yes	No	No

Our opinion: All three of these faucets are very well made and work well. They are similarly priced. We like the piston chamber method, vs ball, because it has a better internal sealing system and does not drip. Having said that, the 630 Perlicks are much better than the 525 Perlicks which had major leaking issues, but we still receive some complaints. The CMBecker faucets have a creamer action which is great when you want a fine head on the end or want to emulate a nitro style head. If you are using this for wine, the option for a longer spout is nice on the CMBecker faucets. We don't think you will go wrong with either faucet, but the CMBecker faucets, which are designed and made in Germany, function extremely well and are packed with features. We also like that the CMBecker comes as the compact V3S or the larger V2G, so you have more style options.
